

SUPERIOR RODENT CONTROL THAT SAVES YOU MONEY.

 **Talon[®] XT Pro**
Rodenticide

syngenta[®]

TALON XT PRO
Rodenticide kills rats and mice in a single feed, making it an exceptional solution for both residential and commercial infestations. Its wax block format also means treating with TALON requires less bait and labour compared to other rodenticides, helping you deliver long-lasting results while saving money.

THE BENEFITS

A highly effective rodent solution

- ▶ Palatable bait that kills rats and mice in a single feed
- ▶ High integrity wax blocks are moisture resistant, weather resistant and durable in all sorts of conditions, providing long-lasting results
- ▶ Kills rodents that are resistant to other rodenticides

More economical than you think

- ▶ TALON delivers value for money with 500 blocks per 10 kg pail
- ▶ To economise, you can use a 'pulsed baiting' technique and put out small quantities of bait at weekly intervals
- ▶ TALON uses 90% less bait to achieve 60% better efficacy compared to bromadiolone, and 75% less bait to achieve over 25% better efficacy than difenacoum

Clean and easy to use

- ▶ HACCP certified
- ▶ Suitable for both indoor and outdoor control
- ▶ With a human taste deterrent included, TALON poses minimal risk to humans and animals when placed in inaccessible areas

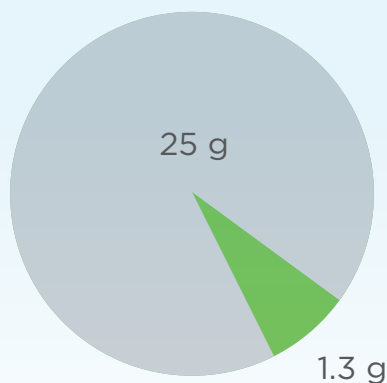

FOR LIFE UNINTERRUPTED™

THE SCIENCE

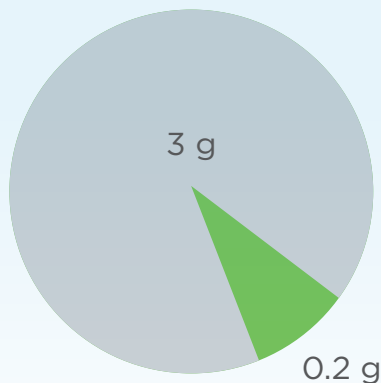

HOW MUCH TALON IS NEEDED FOR A KILL?

Rodents only need to consume a small amount of TALON's active ingredient, brodifacoum, for it to take effect. A lethal dose for mice is about 0.2 g; for rats, it's about 1.3 g. This amounts to only 5% of their typical daily feed intake.

Economical lethal dose

Rattus norvegicus

Mus musculus

TIPS FOR USE

- ▶ For best results, place baits in stations where rodent activity is noticed and away from children and companion animals. Rodents may feed for up to 3 days, but the first feed is lethal and death will normally occur 4-7 days after bait consumption
- ▶ For a cost-effect control program, use the 'pulsed baiting' technique. In this process, small quantities of bait are put out at weekly intervals. The bait at the first application (or 'pulse') are completely consumed and the rodents are given time to die. Once this has happened, more bait is put out for rodents that did not eat at the first pulse. This process is repeated until there are no further signs of rodent activity (usually 2-3 pulses are sufficient)
